                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1127
                          Monoclonal antibody to human interferon type-I receptor - having neutralising activity against human type I interferon, used for therapy and diagnosis

Disclosure; Fig 3, 21pp; English.

Monoclonal antibodies produced against soluble forms of the human interferon alpha-beta receptor based on the full-length human if interferon alpha-beta receptor based on the second apparatus of the second apparatus of the second apparatus of the second apparatus of the second apparatus of the second apparatus of the second apparatus of the second are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment and second activities are useful for treatment activities are useful for treatment activities are useful for treatment activities are useful for treatment activities are useful for treatment activities are useful for the form activities are useful for the form a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human interferon receptor.

Human interferon receptor.

IFN-R; extracellular domain; monoclonal antibody; viral infection; cell proliferation; allograft rejection; systemic lupus erythematosus; psoriasis; multiple sclerosis; Behcet's Disease; aplastic anaemia; immunodeficiency; measles virus; interferon-alpha-beta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1077

Novel, splice-deleted IFWAR forms 1 (W21805) and 2 (W21806) have been detected that lack this transmembrane domain. These, soluble non-membrane bound polypeptides can be expressed in host-cells and used to inhibit, modulate or modify the activities of interferons alpha and beta in cells, tissues and organisms, or for diagnostic

They can be expressed in host cells and used to inhibit, modulate or modify the activities of IFNS alpha and beta in cells, tissues and organisms, or for diagnostic purposes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (W21805) is characterised by a new domain (S) which follows an end-deleted extracellular domain when compared to transmembranal IFNAR (W21804). There is no transmembrane domain. The amino acid sequence is predicted from a cDNA clone (see also T73520) obtd. from human myeloma U266 cells. Soluble, non-membrane bound IFNAR splice-deleted forms 1 and 2 (see also WZ1806) probably regulate

C. (Wovel splice-deleted interferon alpha-receptor (IFNAR) form 2 (W21806) is characterised by a double deletion when compared to transmembranal IFNAR (W21804). The extracellular domain is shortened by 6 amino acid residues and is followed by a truncated intracellular domain. There is no transmembrane region. The amino acid sequence is predicted from a cDNA clone (see also 773521) obtd. Crom human myeloma U266 cells. Soluble, non-membrane bound IFNAR splice-deleted forms 1 (see also W21805) and 2 may regulate the response of human cells to IFNs, either by acting as IFN antagonists or by regulating IFN activities. They can be expressed in host cells and used to inhibit, modulate or modify the activities of IFNs alpha and beta in cells, tissues and organisms, or Sequence 496 AA;
                                                                                                                                                                                                                                                                                              Align seg 1/1 to: W21806 from: 11 to: 496
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               documentation_block:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         rejection, as vaccine adjuvants, for treatment of photosensitivity, inflammation, autoimmune disease and septic shock, while antagonists are potentially useful for increasing immune responses against tumours, viruses, bacteria and parasites (especially intracellular pathogens) and for preventing organ rejection: A vector containing (I) is used to restore, e.g. by gene therapy, II-10, sensitivity to a cell that expresses a dysfunctional IIIOR and is able to bind II-10 but not to transduce a signal. Antisense CRFB4 sequences (especially ribozymes), can inhibit II-10 activity in cells. Antibodies specific for CRFB4 are used to measure and localise CRBF4, for diagnosis of defective II-10 activity. Fragments of (I) are used as primers or probes to assay CRFB4-specific RNA; Agonists/antagonists may be administered parenterally, orally or rectally especially by intravenous injection or directly into a tumour or allocated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence is the human CRFB4 sequence, DNA encoding it is used in the recombinant DNA (I) of the invention. (I) comprises a sequence (S1) encoding the interleukin-10 (II-10) receptor (III)R) and a sequence (S2) encoding CRFB4, both operably linked to expression control sequences. Cells containing (I) may be used to identify agonists/antagonist of II-10. Agonists are potentially useful, e.g. for preventing allograft
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CRFB4 protein.

                                                                                                                                  binding receptor polypeptide and is a novel member of the type 2 cytokin receptor. family (CRF2). An expression vector containing the Zcytor polynucleotide, operably linked to transcription promoter, a sequence encoding a transmembrane and intracellular domain, or both, and a transcriptional terminator can be used to transform host cells for the recombinant production of the polypeptide. The sequences can be used to study the Zcytor7 gene and to isolate ligands binding to it. Zcytor7 is

Patent No. 5731169

GENERAL, INFORMATION:
APPLICANT: MOGENSEN, Knud E.
APPLICANT: UTFALLA, Georges
APPLICANT: LUTFFALLA, Georges
APPLICANT: GRESSER, ION
TITLE OF INVENTION: CDNA FRAGMENT CODING FOR THE GENE FOR
TITLE OF INVENTION: THE ALPHA INTERFERON RECEPTOR AND PROCESS FOR THE
TITLE OF INVENTION: PREPARATION OF THE CORRESPONDING PROTEIN
NUMBER OF SEQUENCES: 2
